

Scan Report

August 8, 2025

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “UTC”, which is abbreviated “UTC”. The task was “scan”. The scan started at Thu Aug 7 23:50:28 2025 UTC and ended at Fri Aug 8 00:30:01 2025 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1	Result Overview	2
1.1	Host Authentications	2
2	Results per Host	2
2.1	192.168.152.129	2

2.1.20	Medium 2121/tcp	42
2.1.21	Medium 25/tcp	43
2.1.22	Medium 5900/tcp	62
2.1.23	Medium 80/tcp	63
2.1.24	Medium 21/tcp	76
2.1.25	Medium 5432/tcp	78
2.1.26	Medium 445/tcp	96
2.1.27	Low 22/tcp	97
2.1.28	Low general/tcp	99
2.1.29	Low 25/tcp	100
2.1.30	Low 5432/tcp	106
2.1.31	Low general/icmp	109

1 Result Overview

Host	High	Medium	Low	Log	False Positive
192.168.152.129	24	40	6	0	0
Total: 1	24	40	6	0	0

Vendor security updates are not trusted.

Overrides are off. Even when a result has an override, this report uses the actual threat of the result.

Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

Issues with the threat level “Log” are not shown.

Issues with the threat level “Debug” are not shown.

Issues with the threat level “False Positive” are not shown.

Only results with a minimum QoD of 70 are shown.

This report contains all 70 results selected by the filtering described above. Before filtering there were 620 results.

1.1 Host Authentications

2.1.1 High 1099/tcp

High (CVSS: 7.5)

NVT: Java RMI Server Insecure Default Configuration RCE Vulnerability - Active Check

Summary

Multiple Java products that implement the RMI Server contain a vulnerability that could allow an unauthenticated, remote attacker to execute arbitrary code (remote code execution/RCE) on a targeted system with elevated privileges.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

By doing an RMI request it was possible to trigger the vulnerability and make the remote host sending a request back to the scanner host (Details on the received packet follows).

Destination IP: 192.168.152.131 (receiving IP on scanner host side)

Destination port: 28377/tcp (receiving port on scanner host side)

Originating IP: 192.168.152.129 (originating IP from target host side)

... continues on next page ...

...continued from previous page ...	
Impact	An unauthenticated, remote attacker could exploit the vulnerability by transmitting crafted packets to the affected software. When the packets are processed, the attacker could execute arbitrary code on the system with elevated privileges.
Solution:	
Solution type: Workaround	
Disable class-loading. Please contact the vendor of the affected system for additional guidance.	
Vulnerability Insight	The vulnerability exists because of an incorrect default configuration of the Remote Method Invocation (RMI) Server in the affected software.
Vulnerability Detection Method	<p>Sends a crafted JRMI request and checks if the target is connecting back to the scanner host.</p> <p>Note: For a successful detection of this flaw the target host needs to be able to reach the scanner host on a TCP port randomly generated during the runtime of the VT (currently in the range of 10000-32000).</p> <p>Details: Java RMI Server Insecure Default Configuration RCE Vulnerability - Active Check</p> <p>OID:1.3.6.1.4.1.25623.1.0.140051</p> <p>Version used: 2025-04-11T15:45:04Z</p>

2.1.2 High 8787/tcp

High (CVSS: 10.0)
NVT: Distributed Ruby (dRuby/DRb) Multiple RCE Vulnerabilities
Summary Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.
Quality of Detection (QoD): 99%
Vulnerability Detection Result The service is running in \$SAFE >= 1 mode. However it is still possible to run a ↵rbbitrary syscall commands on the remote host. Sending an invalid syscall the s ↵ervice returned the following response: Flo:Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'syscall'"0/usr/lib/ ↵ruby/1.8/drb/drb.rb:1555:in 'send'"4/usr/lib/ruby/1.8/drb/drb.rb:1555:in '__se ↵nd__'"A/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'perform_without_block'"3/usr/lib/ ↵ruby/1.8/drb/drb.rb:1515:in 'perform'"5/usr/lib/ruby/1.8/drb/drb.rb:1589:in 'm ↵ain_loop'"0/usr/lib/ruby/1.8/drb/drb.rb:1585:in 'loop'"5/usr/lib/ruby/1.8/drb/ ↵drb.rb:1585:in 'main_loop'"1/usr/lib/ruby/1.8/drb/drb.rb:1581:in 'start'"5/usr ↵/lib/ruby/1.8/drb/drb.rb:1581:in 'main_loop'"/usr/lib/ruby/1.8/drb/drb.rb:143 ↵0:in 'run'"1/usr/lib/ruby/1.8/drb/drb.rb:1427:in 'start'"/usr/lib/ruby/1.8/dr ↵b/drb.rb:1427:in 'run'"6/usr/lib/ruby/1.8/drb/drb.rb:1347:in 'initialize'"/us ↵r/lib/ruby/1.8/drb/drb.rb:1627:in 'new'"9/usr/lib/ruby/1.8/drb/drb.rb:1627:in ↵'start_service'"/usr/sbin/druby_timeserver.rb:12:errnoi+:mesg"Function not im ↵plemented
Impact ... continues on next page ...

...continued from previous page ...
<p>By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.</p>
<p>Solution:</p> <p>Solution type: Mitigation</p> <p>Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:</p> <ul style="list-style-type: none">- Implementing taint on untrusted input- Setting \$SAFE levels appropriately (≥ 2 is recommended if untrusted hosts are allowed to submit Ruby commands, and ≥ 3 may be appropriate)- Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts
<p>Vulnerability Detection Method</p> <p>Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests.</p> <p>Details: Distributed Ruby (dRuby/DRb) Multiple RCE Vulnerabilities</p> <p>OID:1.3.6.1.4.1.25623.1.0.108010</p> <p>Version used: 2024-06-28T05:05:33Z</p>

2.1.3 High general/tcp

High (CVSS: 10.0)
NVT: Operating System (OS) End of Life (EOL) Detection
<p>Product detection result</p> <p>cpe:/o:canonical:ubuntu_linux:8.04</p> <p>Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0 ↪.105937)</p>
<p>Summary</p> <p>... continues on next page ...</p>

...continued from previous page ...
The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The "Ubuntu" Operating System on the remote host has reached the end of life. CPE: <code>cpe:/o:canonical:ubuntu_linux:8.04</code> Installed version, build or SP: 8.04 EOL date: 2013-05-09 EOL info: https://wiki.ubuntu.com/Releases
Impact An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.
Solution: Solution type: Mitigation Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor. Note / Important: Please create an override for this result if the target host is a: - Windows system with Extended Security Updates (ESU) - System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar
Vulnerability Detection Method Checks if an EOL version of an OS is present on the target host. Details: Operating System (OS) End of Life (EOL) Detection OID: 1.3.6.1.4.1.25623.1.0.103674 Version used: 2025-05-21T05:40:19Z
Product Detection Result Product: <code>cpe:/o:canonical:ubuntu_linux:8.04</code> Method: OS Detection Consolidation and Reporting OID: 1.3.6.1.4.1.25623.1.0.105937)

2.1.4 High 513/tcp

High (CVSS: 10.0)
NVT: rlogin Passwordless Login
Summary The rlogin service allows root access without a password.
Quality of Detection (QoD): 80%
Vulnerability Detection Result It was possible to gain root access without a password.
Impact This vulnerability allows an attacker to gain complete control over the target system.
Solution: Solution type: Mitigation Disable the rlogin service and use alternatives like SSH instead.
Vulnerability Detection Method Checks if a vulnerable version is present on the target host. Details: rlogin Passwordless Login OID:1.3.6.1.4.1.25623.1.0.113766 Version used: 2020-09-30T09:30:12Z

High (CVSS: 7.5)
NVT: The rlogin service is running
Summary This remote host is running a rlogin service.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The rlogin service is running on the target system.
Solution: Solution type: Mitigation Disable the rlogin service and use alternatives like SSH instead.
Vulnerability Insight rlogin has several serious security problems, - all information, including passwords, is transmitted unencrypted. ... continues on next page ...

...continued from previous page ...
- .rlogin (or .rhosts) file is easy to misuse (potentially allowing anyone to login without a password)
Vulnerability Detection Method Details: The rlogin service is running OID:1.3.6.1.4.1.25623.1.0.901202 Version used: 2025-03-05T05:38:53Z

dfn-cert: DFN-CERT-2020-0381

[\[return to 192.168.152.129 \]](#)**2.1.8 High 5900/tcp**

High (CVSS: 9.0)

NVT: VNC Brute Force Login

Summary

Try to log in with given passwords via VNC protocol.

Quality of Detection (QoD): 95%**Vulnerability Detection Result**

It was possible to connect to the VNC server with the password: password

Solution:**Solution type:** Mitigation

Change the password to something hard to guess or enable password protection at all.

Vulnerability Insight

This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all.

Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked.

Note as well that passwords can be max. 8 characters long.

Vulnerability Detection Method

Details: VNC Brute Force Login

OID:1.3.6.1.4.1.25623.1.0.106056

Version used: 2021-07-23T07:56:26Z

[\[return to 192.168.152.129 \]](#)**2.1.9 High 512/tcp**

High (CVSS: 10.0) NVT: The rexec service is running
Summary This remote host is running a rexec service.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The rexec service was detected on the target system.
Solution: Solution type: Mitigation Disable the rexec service and use alternatives like SSH instead.
Vulnerability Insight rexec (remote execution client for an exec server) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer. The main difference is that rexec authenticates by reading the username and password *unencrypted* from the socket.
Vulnerability Detection Method Checks whether an rexec service is exposed on the target host. Details: The rexec service is running OID:1.3.6.1.4.1.25623.1.0.100111 Version used: 2023-09-12T05:05:19Z

2.1.10 High 80/tcp

High (CVSS: 10.0) NVT: TWiki XSS and Command Execution Vulnerabilities
Summary TWiki is prone to Cross-Site Scripting (XSS) and Command Execution Vulnerabilities.
Quality of Detection (QoD): 80%
... continues on next page ...

...continued from previous page ...
Vulnerability Detection Result Installed version: 01.Feb.2003 Fixed version: 4.2.4
Impact Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.
Solution: Solution type: VendorFix Upgrade to version 4.2.4 or later.
Affected Software/OS TWiki, TWiki version prior to 4.2.4.
Vulnerability Insight The flaws are due to: - %URLPARAM}% variable is not properly sanitized which lets attackers conduct cross-site scripting attack. - %SEARCH}% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.
Vulnerability Detection Method Details: TWiki XSS and Command Execution Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.800320 Version used: 2024-03-01T14:37:10Z

High (CVSS: 7.4)
NVT: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability
Summary OpenSSL is prone to a security bypass vulnerability.
Quality of Detection (QoD): 70%
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successfully exploiting this issue may allow attackers to obtain sensitive information by conducting a man-in-the-middle attack. This may lead to other attacks.
Solution: Solution type: VendorFix Updates are available. Please see the references for more information.
Affected Software/OS OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m and 1.0.1 before 1.0.1h.
Vulnerability Insight ... continues on next page ...

...continued from previous page ...

OpenSSL does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle attackers to trigger use of a zero-length master key in certain OpenSSL-to-OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the 'CCS Injection' vulnerability.

Vulnerability Detection Method

Send two SSL ChangeCipherSpec request and check the response.

2.1.17 High 514/tcp

High (CVSS: 7.5)
NVT: rsh Unencrypted Cleartext Login
Summary This remote host is running a rsh service.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The rsh service is misconfigured so it is allowing connections without a password or with default root:root credentials.
Solution: Solution type: Mitigation Disable the rsh service and use alternatives like SSH instead.
Vulnerability Insight rsh (remote shell) is a command line computer program which can execute shell commands as another user, and on another computer across a computer network. Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.
Vulnerability Detection Method Details: rsh Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.100080 Version used: 2021-10-20T09:03:29Z

Medium (CVSS: 5.9)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Product detection result

cpe:/a:ietf:transport_layer_security:1.0

Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)

Summary

It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Quality of Detection (QoD): 98%**Vulnerability Detection Result**

In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and SSLv3 protocols and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

... continues on next page ...

...continued from previous page ...
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.
Solution: Solution type: Mitigation It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more resources supporting you with this task.
Affected Software/OS All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.
Vulnerability Insight The SSLv2 and SSLv3 protocols contain known cryptographic flaws like: - CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE) - CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)
Vulnerability Detection Method Checks the used SSL protocols of the services provided by this system. Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection OID:1.3.6.1.4.1.25623.1.0.111012 Version used: 2025-03-27T05:38:50Z

Medium (CVSS: 5.3)
NVT: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048 bits
Summary The remote SSL/TLS server certificate and/or any of the certificates in the certificate chain is using a RSA key with less than 2048 bits.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The remote SSL/TLS server is using the following certificate(s) with a RSA key with less than 2048 bits (public-key-size:public-key-algorithm:serial:issuer): 1024:RSA:00FAF93A4C7FB6B9CC:1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complication of Otherwise Simple Affairs,O=OCUSA,L=Everywhere,ST=There is no such thing outside US,C=XX (Server certificate)
Impact Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.
Solution: Solution type: Mitigation Replace the certificate with a stronger key and reissue the certificates it signed.
Vulnerability Insight SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.
Vulnerability Detection Method ... continues on next page ...

NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)

Summary

The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 70%**Vulnerability Detection Result**

The following indicates that the remote SSL/TLS service is affected:

Protocol Version | Successful re-done SSL/TLS handshakes (Renegotiation) over an
↔ existing / already established SSL/TLS connection-----
↔-----

TLSv1.0 | 10

Impact

The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.

Solution:**Solution type:** VendorFix

Users should contact their vendors for specific patch information.

A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.

Affected Software/OS

Every SSL/TLS service which does not properly restrict client-initiated renegotiation.

Vulnerability Insight

The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols.

Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale:

> It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment.

... continues on next page ...

...continued from previous page ...
Both CVEs are still kept in this VT as a reference to the origin of this flaw.

Medium (CVSS: 4.3)

NVT: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)

Product detection result

cpe:/a:ietf:transport_layer_security

Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0. ↪802067)

Summary

This host is accepting 'RSA_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.

Quality of Detection (QoD): 80%**Vulnerability Detection Result**

... continues on next page ...

<p>...continued from previous page ...</p> <p>'RSA_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:</p> <p>TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA</p> <p>TLS_RSA_EXPORT_WITH_DES40_CBC_SHA</p> <p>TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5</p> <p>TLS_RSA_EXPORT_WITH_RC4_40_MD5</p> <p>'RSA_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:</p> <p>TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA</p> <p>TLS_RSA_EXPORT_WITH_DES40_CBC_SHA</p> <p>TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5</p> <p>TLS_RSA_EXPORT_WITH_RC4_40_MD5</p>
<p>Impact</p> <p>Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.</p>
<p>Solution:</p> <p>Solution type: VendorFix</p> <ul style="list-style-type: none"> - Remove support for 'RSA_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task. - If the service is using OpenSSL: Update to version 0.9.8zd, 1.0.0p, 1.0.1k or later.
<p>Affected Software/OS</p> <ul style="list-style-type: none"> - Hosts accepting 'RSA_EXPORT' cipher suites. - OpenSSL versions prior to 0.9.8zd, 1.0.0 prior to 1.0.0p and 1.0.1 prior to 1.0.1k.
<p>Vulnerability Insight</p> <p>Flaw is due to improper handling RSA temporary keys in a non-export RSA key exchange cipher suite.</p>
<p>Vulnerability Detection Method</p> <p>Checks previous collected cipher suites.</p> <p>Details: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)</p> <p>OID:1.3.6.1.4.1.25623.1.0.805142</p> <p>Version used: 2025-03-27T05:38:50Z</p>

Medium (CVSS: 4.0)	
NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability	
Summary The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).	
Quality of Detection (QoD): 80%	
Vulnerability Detection Result Server Temporary Key Size: 1024 bits	
Impact An attacker might be able to decrypt the SSL/TLS communication offline.	
Solution: Solution type: Workaround - Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task. - For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.	
Affected Software/OS All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.	
Vulnerability Insight The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.	
Vulnerability Detection Method Checks the DHE temporary public key size. Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability. ↪.. OID:1.3.6.1.4.1.25623.1.0.106223

Medium (CVSS: 4.0)
NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm
Summary The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The following certificates are part of the certificate chain but using insecure ↪signature algorithms: Subject: 1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173 ↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic ↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi ↪ng outside US,C=XX Signature Algorithm: sha1WithRSAEncryption
Solution: Solution type: Mitigation Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.
Vulnerability Insight
... continues on next page ...

...continued from previous page ...
<p>The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:</p> <ul style="list-style-type: none"> - Secure Hash Algorithm 1 (SHA-1) - Message Digest 5 (MD5) - Message Digest 4 (MD4) - Message Digest 2 (MD2) <p>Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.</p> <p>NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:</p> <p>Fingerprint1 or fingerprint1, Fingerprint2</p>
<p>Vulnerability Detection Method</p> <p>Check which hashing algorithm was used to sign the remote SSL/TLS certificate.</p> <p>Details: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm</p> <p>OID:1.3.6.1.4.1.25623.1.0.105880</p> <p>Version used: 2021-10-15T11:13:32Z</p>

Medium (CVSS: 6.1)
NVT: jQuery < 1.9.0 XSS Vulnerability
Summary jQuery is prone to a cross-site scripting (XSS) vulnerability.
Quality of Detection (QoD): 80%
Vulnerability Detection Result Installed version: 1.3.2 Fixed version: 1.9.0 Installation path / port: /mutillidae/javascript/ddsmoothmenu/jquery.min.js Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info): - Identified file: http://192.168.152.129/mutillidae/javascript/ddsmoothmenu/jqu↵ery.min.js - Referenced at: http://192.168.152.129/mutillidae/
Solution: Solution type: VendorFix Update to version 1.9.0 or later.
Affected Software/OS jQuery prior to version 1.9.0.
Vulnerability Insight ... continues on next page ...

...continued from previous page ...
<p>The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.</p>
<p>Vulnerability Detection Method Checks if a vulnerable version is present on the target host. Details: jQuery < 1.9.0 XSS Vulnerability OID:1.3.6.1.4.1.25623.1.0.141636 Version used: 2023-07-14T05:06:08Z</p>

Medium (CVSS: 5.8)
NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled
Summary The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.
Quality of Detection (QoD): 99%
Vulnerability Detection Result The web server has the following HTTP methods enabled: TRACE
Impact An attacker may use this flaw to trick your legitimate web users to give him their credentials.
Solution: Solution type: Mitigation Disable the TRACE and TRACK methods in your web server configuration. Please see the manual of your web server or the references for more information.
Affected Software/OS Web servers with enabled TRACE and/or TRACK methods.
Vulnerability Insight It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.
Vulnerability Detection Method Checks if HTTP methods such as TRACE and TRACK are enabled and can be used. Details: HTTP Debugging Methods (TRACE/TRACK) Enabled OID:1.3.6.1.4.1.25623.1.0.11213 Version used: 2023-08-01T13:29:10Z

Medium (CVSS: 5.0)
NVT: /doc directory browsable
Summary The /doc directory is browsable. /doc shows the content of the /usr/doc directory and therefore it shows which programs and - important! - the version of the installed programs.
Quality of Detection (QoD): 80%
Vulnerability Detection Result Vulnerable URL: http://192.168.152.129/doc/
Solution: Solution type: Mitigation Use access restrictions for the /doc directory. If you use Apache you might use this in your access.conf: <pre><Directory /usr/doc> AllowOverride None order deny, allow deny from all allow from localhost </Directory></pre>
Vulnerability Detection Method Details: /doc directory browsable OID:1.3.6.1.4.1.25623.1.0.10056 Version used: 2023-08-01T13:29:10Z
References cve: CVE-1999-0678 url: http://www.securityfocus.com/bid/318

Medium (CVSS: 5.0)
NVT: QWikiwiki directory traversal vulnerability
Summary The remote host is running QWikiwiki, a Wiki application written in PHP. The remote version of this software contains a validation input flaw which may allow an attacker to use it to read arbitrary files on the remote host with the privileges of the web server.
Quality of Detection (QoD): 99%
Vulnerability Detection Result Vulnerable URL: http://192.168.152.129/mutillidae/index.php?page=../../../../../../../../etc/passwd%00
Solution: ... continues on next page ...

...continued from previous page ...
Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Vulnerability Detection Method Details: QWikiwiki directory traversal vulnerability OID:1.3.6.1.4.1.25623.1.0.16100 Version used: 2025-04-15T05:54:49Z
References cve: CVE-2005-0283 url: http://www.securityfocus.com/bid/12163

Medium (CVSS: 5.0)
NVT: awiki <= 20100125 Multiple LFI Vulnerabilities - Active Check
Summary awiki is prone to multiple local file include (LFI) vulnerabilities because it fails to properly sanitize user-supplied input.
Quality of Detection (QoD): 99%
Vulnerability Detection Result Vulnerable URL: http://192.168.152.129/mutillidae/index.php?page=/etc/passwd
Impact An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host.
Solution: Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS awiki version 20100125 and prior.
Vulnerability Detection Method Sends a crafted HTTP GET request and checks the response. Details: awiki <= 20100125 Multiple LFI Vulnerabilities - Active Check
... continues on next page ...

...continued from previous page ...
OID:1.3.6.1.4.1.25623.1.0.103210 Version used: 2025-04-15T05:54:49Z
References url: https://www.exploit-db.com/exploits/36047/ url: http://www.securityfocus.com/bid/49187

Medium (CVSS: 4.8)
NVT: Cleartext Transmission of Sensitive Information via HTTP
Summary The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The following input fields were identified (URL:input name): http://192.168.152.129/dvwa/login.php :password http://192.168.152.129/phpMyAdmin/ :pma_password http://192.168.152.129/phpMyAdmin/?D=A:pma_password http://192.168.152.129/tikiwiki/tiki-install.php :pass http://192.168.152.129/twiki/bin/view/TWiki/TWikiUserAuthentication :oldpassword
Impact An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.
Solution: Solution type: Workaround Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.
Affected Software/OS Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.
Vulnerability Detection Method Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection. The script is currently checking the following: - HTTP Basic Authentication (Basic Auth)
... continues on next page ...

Medium (CVSS: 4.3)
NVT: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability
Product detection result cpe:/a:apache:http_server:2.2.8 Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1 ↪.0.117232)
Summary Apache HTTP Server is prone to a cookie information disclosure vulnerability.
Quality of Detection (QoD): 99%
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow attackers to obtain sensitive information that may aid in further attacks.
Solution: Solution type: VendorFix Update to Apache HTTP Server version 2.2.22 or later.
Affected Software/OS Apache HTTP Server versions 2.2.0 through 2.2.21.
Vulnerability Insight The flaw is due to an error within the default error response for status code 400 when no custom ErrorDocument is configured, which can be exploited to expose 'httpOnly' cookies.
Vulnerability Detection Method Details: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability OID:1.3.6.1.4.1.25623.1.0.902830

NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability	
Summary	
... continues on next page ...	

...continued from previous page ...
phpMyAdmin is prone to a cross-site scripting (XSS) vulnerability.
Quality of Detection (QoD): 99%
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.
Solution: Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS phpMyAdmin version 3.3.8.1 and prior.
Vulnerability Insight The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.
Vulnerability Detection Method Details: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability OID:1.3.6.1.4.1.25623.1.0.801660 Version used: 2023-10-17T05:05:34Z

[\[return to 192.168.152.129 \]](#)

2.1.24 Medium 21/tcp

Medium (CVSS: 6.4)
NVT: Anonymous FTP Login Reporting
Summary Reports if the remote FTP Server allows anonymous logins.
Quality of Detection (QoD): 80%
Vulnerability Detection Result It was possible to login to the remote FTP service with the following anonymous ↪account(s): anonymous:anonymous@example.com ftp:anonymous@example.com
Impact Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to: - gain access to sensitive files - upload or delete files.
Solution: Solution type: Mitigation If you do not want to share files, you should disable anonymous logins.
Vulnerability Insight A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data. Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.
Vulnerability Detection Method Details: Anonymous FTP Login Reporting OID:1.3.6.1.4.1.25623.1.0.900600 Version used: 2021-10-20T09:03:29Z
References cve: CVE-1999-0497

Medium (CVSS: 4.8)
NVT: FTP Unencrypted Cleartext Login
Summary The remote host is running a FTP service that allows cleartext logins over unencrypted connections.
Quality of Detection (QoD): 70%
Vulnerability Detection Result The remote FTP service accepts logins without a previous sent 'AUTH TLS' command ↩. Response(s): Non-anonymous sessions: 331 Please specify the password. Anonymous sessions: 331 Please specify the password.
Impact An attacker can uncover login names and passwords by sniffing traffic to the FTP service.
Solution: Solution type: Mitigation Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.
Vulnerability Detection Method Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command. Details: FTP Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.108528 Version used: 2023-12-20T05:05:58Z

[\[return to 192.168.152.129 \]](#)

2.1.25 Medium 5432/tcp

Medium (CVSS: 5.9)
NVT: SSL/TLS: Report Weak Cipher Suites
Product detection result cpe:/a:ietf:transport_layer_security Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.↩802067)
... continues on next page ...

...continued from previous page ...
Summary This routine reports all weak SSL/TLS cipher suites accepted by a service.
Quality of Detection (QoD): 98%
Vulnerability Detection Result 'Weak' cipher suites accepted by this service via the SSLv3 protocol: TLS_RSA_WITH_RC4_128_SHA 'Weak' cipher suites accepted by this service via the TLSv1.0 protocol: TLS_RSA_WITH_RC4_128_SHA
Impact This could allow remote attackers to obtain sensitive information or have other, unspecified impacts.
Solution: Solution type: Mitigation The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore. Please see the references for more resources supporting you with this task.
Affected Software/OS All services providing an encrypted communication using weak SSL/TLS cipher suites.
Vulnerability Insight These rules are applied for the evaluation of the cryptographic strength: - RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808) - Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000) - 1024 bit RSA authentication is considered to be insecure and therefore as weak - Any cipher considered to be secure for only the next 10 years is considered as medium - Any other cipher is considered as strong
Vulnerability Detection Method Checks previous collected cipher suites. NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication. Details: SSL/TLS: Report Weak Cipher Suites OID:1.3.6.1.4.1.25623.1.0.103440 Version used: 2025-03-27T05:38:50Z

Medium (CVSS: 5.9)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Product detection result

cpe:/a:ietf:transport_layer_security:1.0

Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)

Summary

It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Quality of Detection (QoD): 98%**Vulnerability Detection Result**

In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020) VT.

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

... continues on next page ...

...continued from previous page ...
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.
Solution: Solution type: Mitigation It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more resources supporting you with this task.
Affected Software/OS All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.
Vulnerability Insight The SSLv2 and SSLv3 protocols contain known cryptographic flaws like: - CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE) - CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)
Vulnerability Detection Method Checks the used SSL protocols of the services provided by this system. Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection OID:1.3.6.1.4.1.25623.1.0.111012 Version used: 2025-03-27T05:38:50Z

Medium (CVSS: 5.3)
NVT: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048 bits
Summary The remote SSL/TLS server certificate and/or any of the certificates in the certificate chain is using a RSA key with less than 2048 bits.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The remote SSL/TLS server is using the following certificate(s) with a RSA key with less than 2048 bits (public-key-size:public-key-algorithm:serial:issuer): 1024:RSA:00FAF93A4C7FB6B9CC:1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complication of Otherwise Simple Affairs,O=OCUSA,L=Everywhere,ST=There is no such thing outside US,C=XX (Server certificate)
Impact Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.
Solution: Solution type: Mitigation Replace the certificate with a stronger key and reissue the certificates it signed.
Vulnerability Insight SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.
Vulnerability Detection Method ... continues on next page ...

...continued from previous page ...
Checks the RSA keys size of the server certificate and all certificates in chain for a size < 2048 bit. Details: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048. ↪... OID:1.3.6.1.4.1.25623.1.0.150710 Version used: 2021-12-10T12:48:00Z

Medium (CVSS: 5.0)	
NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)	
Summary The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.	
Quality of Detection (QoD): 70%	
Vulnerability Detection Result The following indicates that the remote SSL/TLS service is affected: Protocol Version Successful re-done SSL/TLS handshakes (Renegotiation) over an ↔ existing / already established SSL/TLS connection ----- ↔----- TLSv1.0 10	
Impact The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.	
Solution: Solution type: VendorFix Users should contact their vendors for specific patch information.	
... continues on next page ...	

...continued from previous page ...
A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.
Affected Software/OS Every SSL/TLS service which does not properly restrict client-initiated renegotiation.
Vulnerability Insight The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols. Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale: > It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment. Both CVEs are still kept in this VT as a reference to the origin of this flaw.
Vulnerability Detection Method Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection. Details: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094) OID:1.3.6.1.4.1.25623.1.0.117761 Version used: 2024-09-27T05:05:23Z

Medium (CVSS: 4.0)

NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

... continues on next page ...

...continued from previous page ...
Summary The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.
Quality of Detection (QoD): 80%
Vulnerability Detection Result The following certificates are part of the certificate chain but using insecure ↪signature algorithms: Subject: 1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173 ↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic ↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi ↪ng outside US,C=XX Signature Algorithm: sha1WithRSAEncryption
Solution: Solution type: Mitigation Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.
Vulnerability Insight The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use: - Secure Hash Algorithm 1 (SHA-1) - Message Digest 5 (MD5) - Message Digest 4 (MD4) - Message Digest 2 (MD2) Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates. NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive: Fingerprint1 or fingerprint1, Fingerprint2
Vulnerability Detection Method Check which hashing algorithm was used to sign the remote SSL/TLS certificate. Details: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm OID:1.3.6.1.4.1.25623.1.0.105880 Version used: 2021-10-15T11:13:32Z

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Quality of Detection (QoD): 80%**Vulnerability Detection Result**

Server Temporary Key Size: 1024 bits

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:**Solution type:** Workaround

- Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task.
- For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Affected Software/OS

All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.

Vulnerability Insight

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability.

[[return to 192.168.152.129](#)]

2.1.26 Medium 445/tcp

Medium (CVSS: 6.0)
NVT: Samba 3.0.0 <= 3.0.25rc3 MS-RPC Remote Shell Command Execution Vulnerability - Active Check
Product detection result cpe:/a:samba:samba:3.0.20 Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
Summary Samba is prone to a vulnerability that allows attackers to execute arbitrary shell commands because the software fails to sanitize user-supplied input.
Quality of Detection (QoD): 99%
Vulnerability Detection Result By sending a special crafted SMB request it was possible to execute ‘‘ping -p 5f ↪4f70656e564153565431393036335f -c50 192.168.152.131’’ on the remote host. Received answer (ICMP "Data" field): 0x00: 1D 42 95 68 81 25 08 00 56 54 31 39 30 36 33 5F .B.h.%..VT19063_ 0x10: 5F 4F 70 65 6E 56 41 53 56 54 31 39 30 36 33 5F _OpenVASVT19063_ 0x20: 5F 4F 70 65 6E 56 41 53 56 54 31 39 30 36 33 5F _OpenVASVT19063_ 0x30: 5F 4F 70 65 6E 56 41 53 _OpenVAS
Impact An attacker may leverage this issue to execute arbitrary shell commands on an affected system with the privileges of the application.
... continues on next page ...

...continued from previous page ...
Solution: Solution type: VendorFix Updates are available. Please see the referenced vendor advisory.
Affected Software/OS Samba versions 3.0.0 through 3.0.25rc3.
Vulnerability Detection Method Sends a crafted SMB request and checks if the target is connecting back to the scanner host. Note: For a successful detection of this flaw the scanner host needs to be able to directly receive ICMP echo requests from the target. Details: Samba 3.0.0 <= 3.0.25rc3 MS-RPC Remote Shell Command Execution Vulnerability - . ↪.. OID:1.3.6.1.4.1.25623.1.0.108011 Version used: 2025-03-18T05:38:50Z

2.1.28 Low general/tcp

Low (CVSS: 2.6)
NVT: TCP Timestamps Information Disclosure
Summary The remote host implements TCP timestamps and therefore allows to compute the uptime.
Quality of Detection (QoD): 80%
Vulnerability Detection Result It was detected that the host implements RFC1323/RFC7323. The following timestamps were retrieved with a delay of 1 seconds in-between: Packet 1: 133484 Packet 2: 133591
Impact A side effect of this feature is that the uptime of the remote host can sometimes be computed.
Solution: Solution type: Mitigation To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime. To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment. See the references for more information.
Affected Software/OS TCP implementations that implement RFC1323/RFC7323.
Vulnerability Insight The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.
Vulnerability Detection Method Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported. Details: TCP Timestamps Information Disclosure OID:1.3.6.1.4.1.25623.1.0.80091 Version used: 2023-12-15T16:10:08Z

[\[return to 192.168.152.129 \]](#)

2.1.29 Low 25/tcp

Low (CVSS: 3.7)
NVT: SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam)
Product detection result cpe:/a:ietf:transport_layer_security Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.↪802067)
Summary This host is accepting 'DHE_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.
Quality of Detection (QoD): 80%
Vulnerability Detection Result 'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_RC4_40_MD5 'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
Impact Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.
Solution: Solution type: VendorFix - Remove support for 'DHE_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task. - If the service is using OpenSSL: Update to version 1.0.1n, 1.0.2b or later.
... continues on next page ...

...continued from previous page ...
Affected Software/OS - Hosts accepting 'DHE_EXPORT' cipher suites. - OpenSSL versions prior to 1.0.1n and 1.0.2 prior to 1.0.2b.
Vulnerability Insight Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.
Vulnerability Detection Method Checks previous collected cipher suites. Details: SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam) OID:1.3.6.1.4.1.25623.1.0.805188 Version used: 2025-03-27T05:38:50Z

Low (CVSS: 3.4)

NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)

Product detection result

cpe:/a:ietf:transport_layer_security

Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.↔802067)

Summary

This host is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 80%**Vulnerability Detection Result**

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution:**Solution type:** Mitigation

Possible Mitigations are:

- Disable SSLv3
- Disable cipher suites supporting CBC cipher modes
- Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+

NVT: ICMP Timestamp Reply Information Disclosure

Summary

The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%**Vulnerability Detection Result**

The following response / ICMP packet has been received:

- ICMP Type: 14
- ICMP Code: 0

Impact

This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:**Solution type:** Mitigation

Various mitigations are possible:

- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight

The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method

Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.
